# WEEKLY HEALTH REPORT

## NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. Troops in transit and certain small detachments are not required to submit reports; for this and other reasons, total strength of reporting units has been consistently about 1 percent below the actual strength of the Army in this country. The mean strength shown for individual stations is that of Army personnel attached or assigned for medical care and does not include organizations not on the post but dependent on the station for hospitalization.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

### MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or longer, except for certain cases carded for record only (chiefly venereal disease cases treated on a duty status, and deaths which occurred before admission to hospital or quarters). Admissions designated as "injury" comprise all traumatisms other than battle casualties (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications as well as various types of wounds not due to enemy action). Under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties. All cases other than those of injury or battle casualty are classified as "disease." The presence of Ports of Embarkation and of large numbers of casuals admitted should be borne in mind in making comparisons between Service Commands and individual stations.

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The average proportion of the daily strength of the command which is confined to hospital or quarters (mean number of non-effectives per thousand strength) is given in the summary table for the total United States and for

each of the Service Commands. This ratio may not be significant when the strength of a Command is changing markedly or when a Command has a relatively large number of General Hospitals.

The number of enlisted men discharged during the week on Certificates of Disability for Discharge (CDD) are shown for individual stations. These data should be distinguished from the figures for "honorable discharges for physical and mental disqualification" assembled by The Adjutant General's Office; the latter include discharges for inaptness in addition to CDD's and are tabulated on a somewhat different basis (e.g., the April data represent April discharges processed by the AGO during April and May plus discharges prior to April which were processed in May).

### MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 15 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

### STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

### EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station have not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

## COMMENT ON CURRENT TRENDS

### CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

#### All Causes: Disease and Injury:

During the week ending 17 November 1944 the admission rate from all causes increased fractionally (by about 3 percent) to 571 per year per thousand strength. The current week's morbidity is about 15 percent below that for the corresponding week of 1943. Morbidity from disease increased slightly during the current week to 510 per thousand strength.

The admission rate from injury decreased to 61 per thousand. This is the lowest rate reported so far this year but is not strictly comparable with rates reported prior to October; the current relatively low level of injuries reflects compliance with the recently issued directive regarding reportable injuries. This clarification provided that readmitted cases and injuries existing prior to entry into active service should be reported as "disease" rather than as "injury," whereas previously these were reported as "injuries." Because of this, it may be anticipated that the injury admission rate for some weeks to come may show more of a downward tendency than would otherwise have prevailed.

#### Respiratory Causes:

Morbidity from colds, influenza, etc. increased slightly to 94 per thousand. During the past six weeks morbidity from these causes has varied only within the relatively narrow limits of 91 to 95 per thousand. The admission rate from these causes for the current week was about 15 percent lower than for the corresponding week of 1943.

The admission rate from pneumonia decreased slightly for the second week to 8 per thousand and is currently at the lowest level since the middle of October. Morbidity from this cause was somewhat below that for the corresponding week of 1943.

#### Common Communicable Diseases:

Morbidity from venereal diseases, excluding cases contracted prior to entry into active service, increased to 40 per thousand which is the highest rate reported so far this year except for the week ending 27 October. The current week's increase reflects the tendency for the admission rate from these causes to increase gradually throughout the month, reaching a peak in the last week.

Morbidity from diarrhea and dysentery remained at 8 per thousand. The number of new cases of meningitis was reported at 15 as compared with 22 for the previous week. The number of new cases of rheumatic fever continued at about the same level as has prevailed during the past three months (namely, 40 to 60 cases per week).

### VARIATIONS IN MORBIDITY BY SERVICE COMMAND

#### All Causes: Disease and Injury:

The admission rate from disease increased in all Service Commands except the Second and Fourth. The greatest increases were reported by the Sixth, Seventh, First, and Third Service Commands.

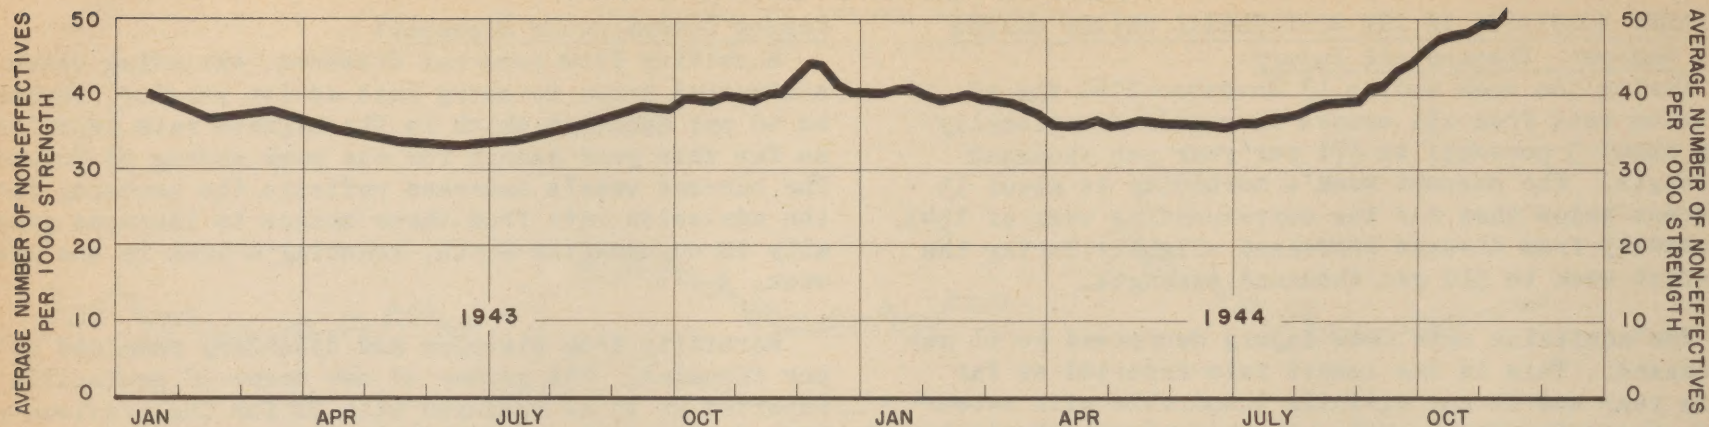

The Third Service Command reported the highest morbidity from all causes (718 per thousand) and from disease (673 per thousand), followed by the Second Service Command which was the only other one to report morbidity from disease in excess of 600 per thousand. The lowest morbidity from all causes (508 per thousand) and from disease (444 per thousand) was again registered in the Eighth Service Command, which has continued to report very low morbidity in recent months.

Most Service Commands reported lower morbidity from injuries, with the greatest decreases occurring in the First, Sixth, and Eighth Service Commands and the Military District of Washington. Only the Fourth Service Command (with a rate of 73 per thousand) reported an admission rate from injury in excess of 65 per thousand.

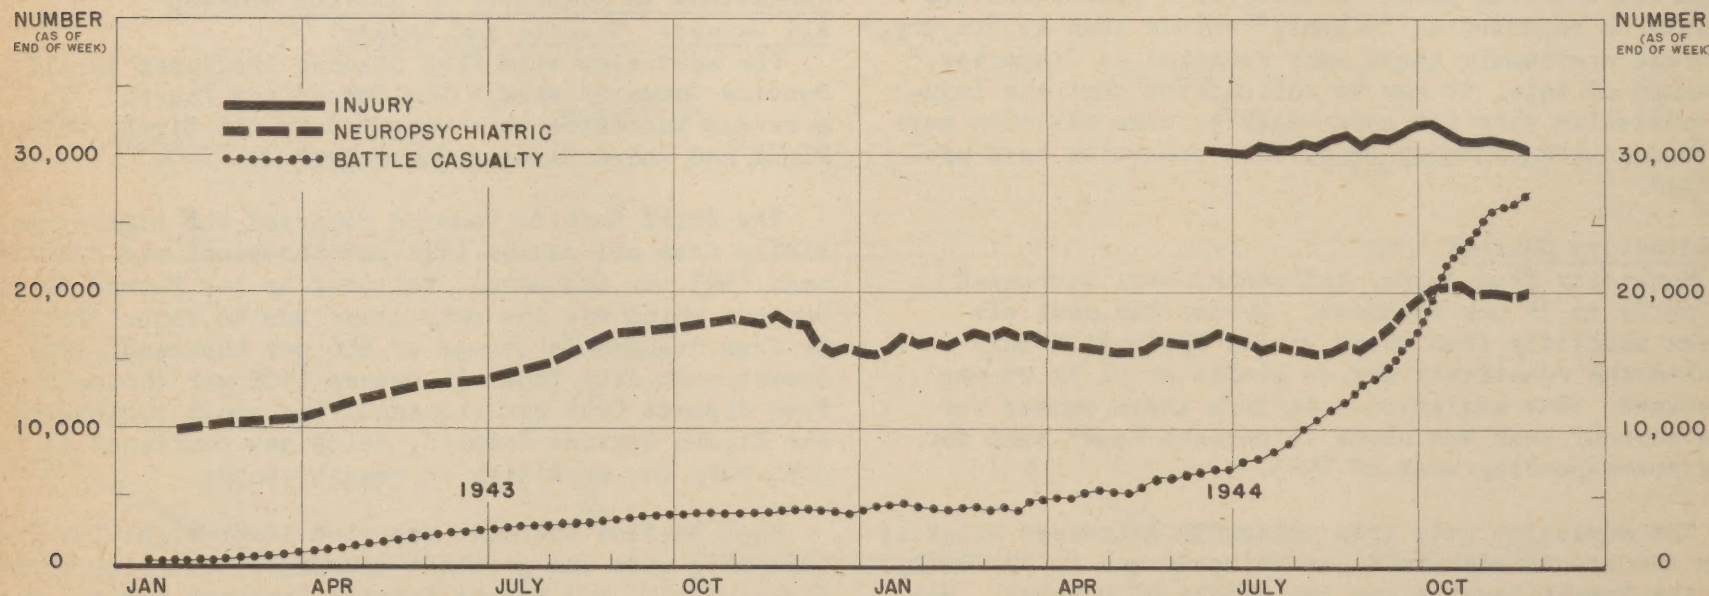

# NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

# PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

## COMMENT ON CURRENT TRENDS (CONT'D)

Rates of less than 50 per thousand were reported by the First, Second, Third, and Sixth Service Commands and the Military District of Washington.

Respiratory Causes:

The admission rate from colds, influenza, etc. again showed considerable variation from one Service Command to another. Increases of 10 percent or more were reported by the Sixth and Eighth Service Commands and the Military District of Washington, while a decrease of similar magnitude occurred in the First Service Command. The Military District of Washington reported the highest morbidity from colds, influenza, etc. (157 per thousand), followed by the Second, Third, and Ninth Service Commands (about 115 per thousand). Only the Fourth, Seventh, and Eighth Service Commands, with rates ranging between 79 and 86 per thousand, reported morbidity of less than 100 per thousand.

Morbidity from pneumonia decreased notably in the Sixth Service Command and to a moderate degree in the majority of other Commands. Nonetheless, the Sixth Service Command, with a rate of 17 per thousand or more than double that for the country as a whole, reported the highest morbidity from this cause.

Morbidity from "new" venereal (excluding EPTS) cases increased in all Service Commands except the Third and Eighth (in the latter only a fractional decrease occurred); the greatest increases were reported by the First, Fifth, and Sixth Service Commands. The First Service Command reported the highest morbidity from these causes (64 per thousand), followed by the Fifth Service Command (60 per thousand). The high experience of the First Service Command is due in part to the presence of task force troops not under its jurisdiction.

All Service Commands reported relatively low morbidity from diarrhea and dysentery. Only the Fifth and Eighth Service Commands reported admission rates from these causes in excess of 10 per thousand.

NON-EFFECTIVE RATE:

The non-effective rate increased for the eighteenth consecutive week to 51.0 per thousand; this is the highest rate recorded during this war. More than 25 percent of the current non-effective rate arises from days of treatment for cases evacuated from overseas theaters. The non-effective rate for personnel stationed in this country is estimated to be lower than in 1943.

PATIENTS REMAINING UNDER TREATMENT: 17 November 1944:

The number of neuropsychiatric cases remaining was reported at 20,148 or about 400 more than for the previous week. The number of non-battle injury patients remaining totaled about 30,200. The number of battle casualty patients remaining increased by about 1600 to number 27,907.

CERTIFICATES OF DISABILITY FOR DISCHARGE:

During the week ending 17 November there were 4,803 enlisted men discharged by CDD or about 200 less than the previous week. About 50 percent of these discharges were reported by General Hospitals. Included among the 4,803 CDD's were 1,704 neuropsychiatric cases.

# COMMENT ON RECENT DEVELOPMENTS

FOR THE FOUR WEEK PERIOD ENDING 27 OCTOBER 1944

## NATURE OF THE DATA:

The data of this Monthly Report, like those of the Weekly Health Reports, have been taken from Forms 86ab rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. However, unlike the Weekly Health Reports which are compiled on the basis of the figures as received, so as to place the information in circulation at the earliest possible time, the figures here presented for the four week period ending 27 October 1944 include the great majority of the corrected reports as well as reports received too late to be incorporated in the Weekly Health Report.

This Report covers morbidity and mortality data for all individual stations with a strength of 1000 or over and gives details for admissions from venereal diseases and for neuropsychiatric cases.

Charts showing morbidity trends from all causes, from all diseases combined, from injury, and from colds, influenza, etc. are presented on page 29. Similar charts for specified diseases appear on pages 31, 33, and 35. A chart showing mortality trends is presented on page 37. A summary for the month of the number of admissions and corresponding morbidity rates and of the number of deaths and corresponding mortality rates for the United States as a whole and for the Service Commands is given on page 38. The most pertinent morbidity data for individual stations are presented on pages 39 to 65. On pages 66 and 67 the seven stations with the highest rates of admission during the month are shown for each of the morbidity categories considered.

In reading the detailed tables, it should be borne in mind that morbidity (or mortality) rates based on small numbers of cases are not reliable. For this reason the symbol "?" has been placed after rates

computed on the basis of 5 or fewer cases. Attention is directed to the definitions of admissions and admission rates and the discussion of the proportion of total Army strength included in the stations covered by this Report as given on page 2. The term "month" in this report is used to denote the four or five week period based on the number of Fridays in the calendar month.

## MORBIDITY FROM ALL CAUSES: DISEASE AND INJURY

Admission rates from all causes and from disease increased fractionally (by about 1 percent) in October. The Navy's morbidity experience at shore stations in the continental United States showed a similar increase in October over September. Although morbidity during September and October has been about 5 percent above the minimum rates for the year registered during the period from June through August, current experience is well under that of the winter and spring months of this year. The October admission rate from all causes (577 per year per thousand strength), while the highest during the last five months, was nonetheless 12 percent below the rate for October 1943, which was the lowest recorded that year.

The admission rate from injury decreased to 66 per thousand; except for April this is the lowest rate reported this year. It is believed that the current relatively low level of injuries reflects compliance with the recently issued directive in regard to the reporting of readmitted and EPTS injuries as "disease" rather than as "injury." Current morbidity from injury is about 15 percent lower than for the corresponding month of 1943.

Higher morbidity from disease in October as compared with September was reported by every Service Command except the Fourth and Fifth, in which moderate

## COMMENT ON RECENT DEVELOPMENTS (CONT'D)

decreases occurred. The greatest increases were registered in the First, Second, and Third Service Commands, in all of which a rise of more than 10 percent was registered.

The Second Service Command reported in October the highest admission rates from all causes and from disease (both being about 25 percent higher than for the country as a whole). The lowest admission rates from all causes and from disease were registered in the Eighth Service Command (both about 10 percent under the United States rates). With the seasonal increase in the admission rate from respiratory diseases, the variations by Service Command in the admission rate from all diseases tend to increase as compared with the summer months.

The highest morbidity from injury was reported by the Fourth and Eighth Service Commands (about 73 per thousand), no other Command having a rate in excess of 65 per thousand. The lowest admission rates were recorded in the First and Second Service Commands and the Military District of Washington, all of which had rates of between 50 and 55 per thousand.

RESPIRATORY DISEASES:

The October admission rate from colds, influenza, etc. was 92 per thousand or almost 15 percent in excess of that for September. For the last three months there has been a steady, although moderate, increase in the admission rate from these causes from the very low level which prevailed during the summer months. Nevertheless the rate for October 1944 was 12 percent lower than for October 1943 and more than 80 percent under the peak rate of December 1943.

Morbidity from colds, influenza, etc. increased in all Service Commands except the Fifth, in which only a fractional decrease occurred. Increases of 15 percent or more were reported by the First, Second, Third,

Fourth, and Ninth Service Commands and the Military District of Washington. The Military District of Washington reported the highest morbidity from these causes (161 per thousand) followed by the Second Service Command (139 per thousand), while the lowest rates occurred in the Fourth and Eighth Service Commands (about 80 per thousand).

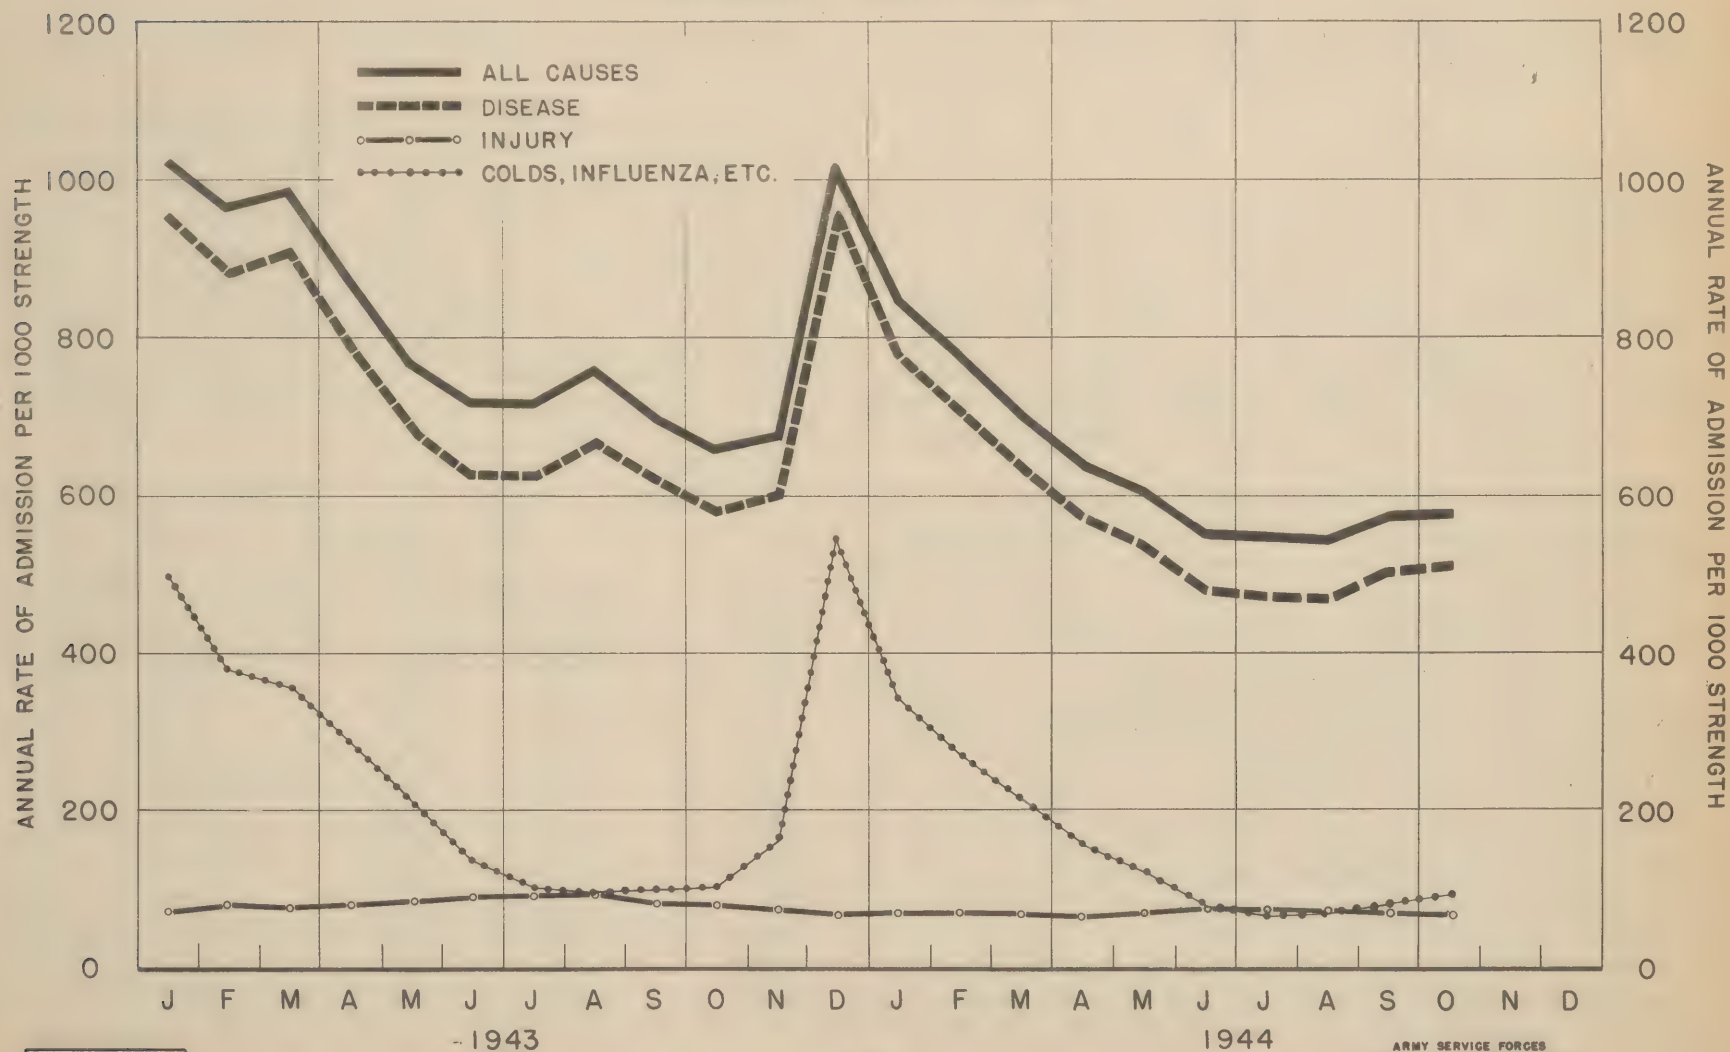

Morbidity from all forms of pneumonia combined increased almost 30 percent during October. Nevertheless, current experience is about 15 percent lower than for October 1943 and is less than half the peak rate for December 1943.

Morbidity from pneumonia was higher in October in practically every Service Command. The Sixth Service Command continued to experience by far the highest admission rate from this cause; the October rate in this Command was about 40 percent higher than in September and more than double the October rate for the country as a whole.

In October atypical pneumonia accounted for slightly under 70 percent of all pneumonia admissions; this is a considerably lower proportion than during the previous two months when about 75 percent of the total cases were so reported. The percentage of pneumonia cases diagnosed as atypical was highest in the Fourth and Fifth Service Commands, in both of which the proportion was 75 percent or more.

# MORBIDITY FROM — ALL CAUSES — DISEASE — INJURY — COLDS, INFLUENZA, ETC.

CONTINENTAL UNITED STATES

RESTRICTED

## COMMENT ON RECENT DEVELOPMENTS (CONT'D)

DIARRHEA AND DYSENTERY:

Morbidity from diarrhea and dysentery decreased only slightly in October. In previous years the admission rate from these causes showed a considerable decline from August to October but this did not occur in 1944, in part because morbidity from these causes had been at a relatively low level during the summer months. As a result the admission rate for October 1944 was at about the same level as during the corresponding month of 1943.

VENEREAL DISEASES:

Morbidity from venereal diseases, excluding cases contracted prior to entry into active service, increased fractionally in October to 37.7 per thousand, which is the highest admission rate from these causes reported since February 1942. The Navy's experience with venereal diseases was slightly lower in October than in September, but remained nevertheless at a relatively high level as contrasted with previous months.

For the first time in four months the admission rate for syphilis, excluding EPTS cases, recorded a slight decline in contrast with the previous slow upward trend of recent months. On the other hand the admission rate from gonorrhea, excluding EPTS cases, continued its upward movement and was at the highest level for any month so far during this war. Morbidity from venereal diseases other than syphilis and gonorrhea, excluding EPTS cases, remained at 1.1 per thousand, which is the lowest figure thus far recorded.

Markedly higher morbidity from venereal diseases, excluding EPTS cases, was reported in October by the First and Second Service Commands, with no Service Command showing any significant decrease. It should be noted that the First and Second Service Commands contained a relatively large number of task force troops not under their jurisdiction, which troops account in large part for the relatively high morbidity

from venereal disease in these Commands.

The highest morbidity from venereal disease, excluding EPTS cases, was reported by the First and Fifth Service Commands, which had rates about 50 percent higher than for the country as a whole. Relatively low admission rates were recorded in the Military District of Washington and the Ninth Service Command.

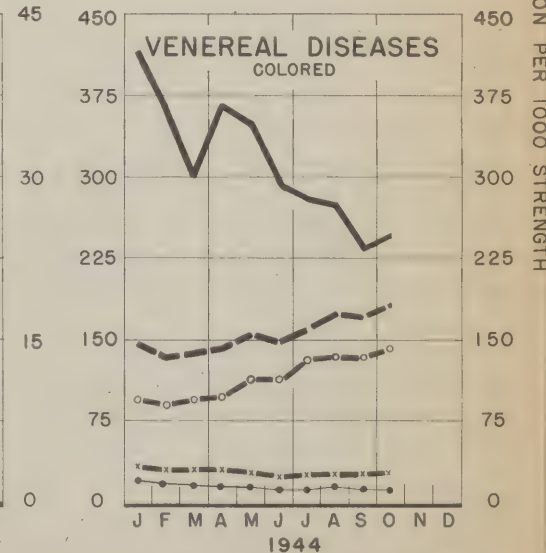

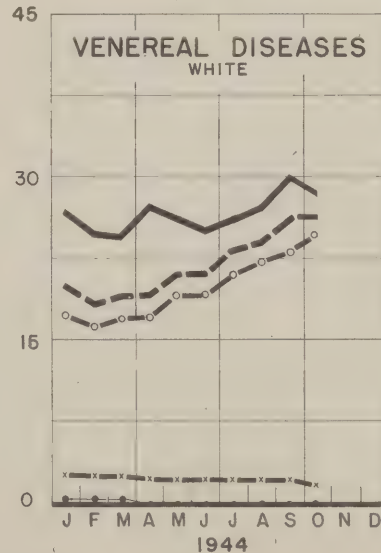

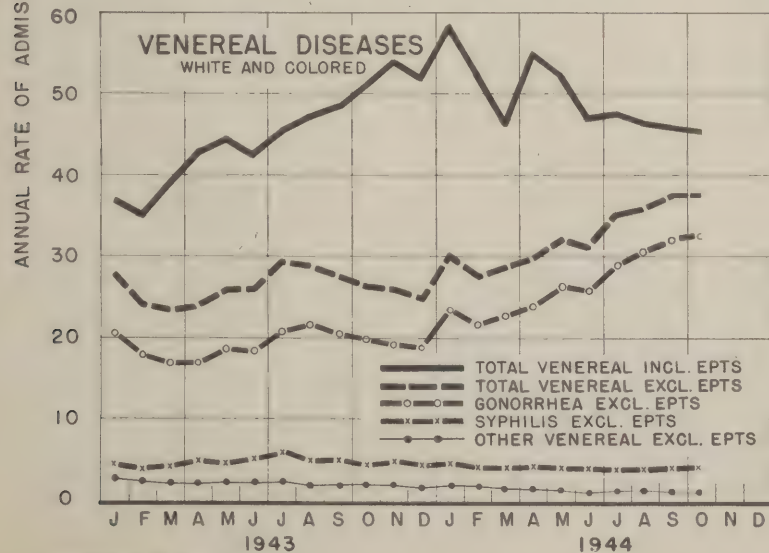

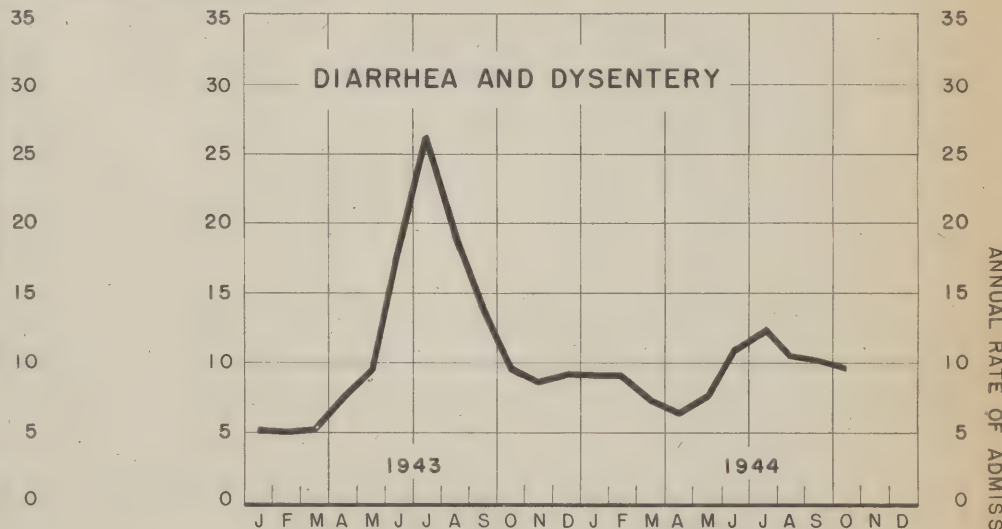

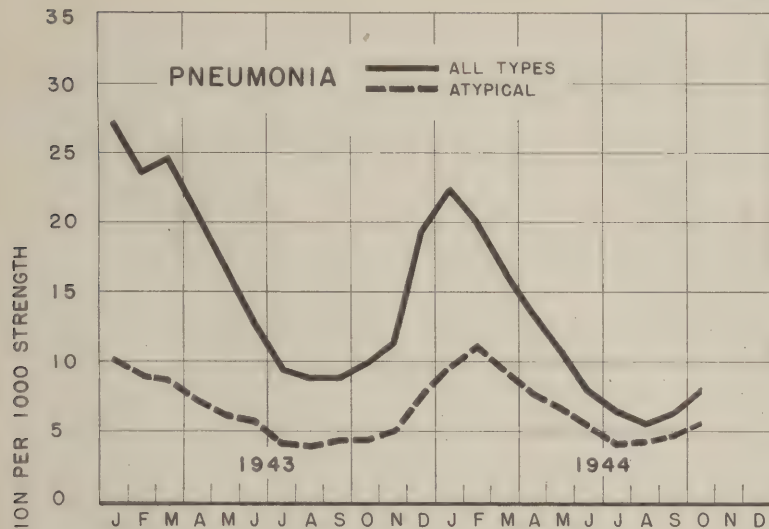

Morbidity represented by venereal EPTS cases was reported at 7.7 per thousand during October against 8.5 per thousand for September. The admission rate from this cause has been decreasing steadily during recent months as a result of the downward trend in the number of men inducted into the Army. Variations in the admission rate for venereal EPTS cases as between Service Commands have relatively little significance, because they reflect a different geographical and racial distribution of Army personnel as compared with that of new inductees.

The venereal disease cases remaining under treatment on 27 October are shown below:

Service Command	Number Remaining Under Treatment		Venereal Disease Cases as Percent of All Cases	
	Syphilis	Other	Syphilis	Other
TOTAL U.S.	1437	1423	.85	.85
I	44	30	.7	.5
II	68	113	.6	1.0
III	234	125	1.9	1.0
MDW	10	29	.2	.7
IV	319	239	.8	.6
V	71	168	.5	1.1
VI	17	72	.2	.8
VII	76	123	.5	.9
VIII	376	308	1.2	1.0
IX	222	216	.9	.9

# MORBIDITY FROM ————— PNEUMONIA DIARRHEA AND DYSENTERY VENEREAL DISEASES

CONTINENTAL UNITED STATES

## COMMENT ON RECENT DEVELOPMENTS (CONT'D)

The great bulk of the cases remaining were contracted after entry on active service. The number of syphilis cases remaining at the end of October was about the same as for September, while the number of cases of other venereal diseases decreased 20 percent. Total venereal cases represented 1.70 percent of the total number of patients remaining under treatment in hospital. The very much longer duration of hospitalization for syphilis is indicated by the fact that only 11 percent of the total venereal admissions (excluding EPTS cases) were for this cause, even though 50 percent of the cases remaining under treatment were syphilis cases.

The total number of days lost from duty during October because of venereal disease was about 84,000 or an average of 21,000 per week; this represented a non-effective rate of .84 per thousand or about the same as for the previous four months.

The very much higher incidence of venereal disease among colored as compared with white personnel is indicated in the chart on page 31. For colored troops in 1944 morbidity from venereal disease, excluding EPTS cases, has been consistently about seven times as high as for the remainder of the Army, while for EPTS cases the colored admission rate has been 30 times as high. More detailed data as to the September incidence of venereal diseases by color are presented in the Special Health Report contained in Weekly Health Report No. 43 (page 27).

MEASLES:

Morbidity from measles increased slightly to .2 per thousand, which is about the same as reported during the previous two months and well below that for the corresponding period of 1943.

MUMPS:

Morbidity from mumps decreased about 20 percent in

October, but nevertheless remained considerably higher than the rate for either measles or scarlet fever. The October 1944 rate is slightly higher than that for October 1943, which was the minimum rate recorded for that year.

SCARLET FEVER:

Morbidity from scarlet fever increased sharply (although only to .4 per thousand). Nevertheless, current experience is somewhat lower than during the corresponding period of 1943.

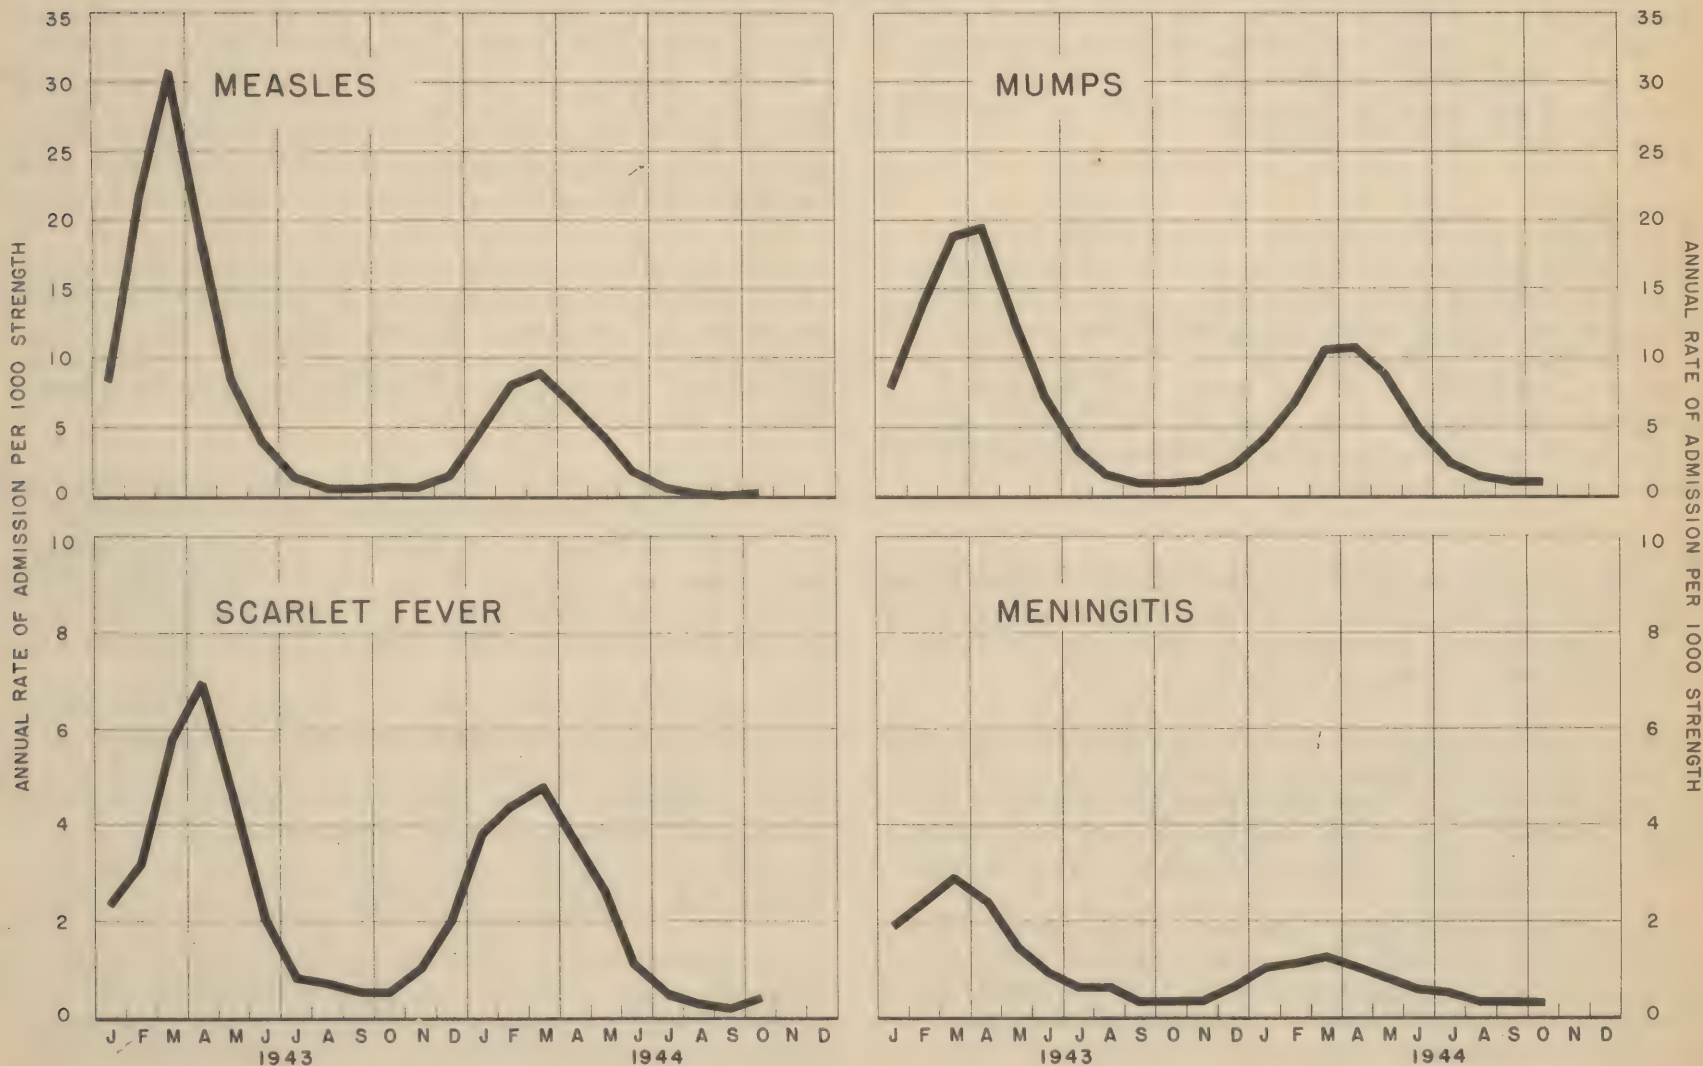

MENINGOCOCCIC MENINGITIS:

Morbidity from meningitis was reported at .3 per thousand for the third successive month. This is the same as during the period from September to November 1943 when the lowest morbidity from this cause was recorded for that year.

# MORBIDITY FROM — MEASLES — MUMPS

## SCARLET FEVER — MENINGITIS

### CONTINENTAL UNITED STATES

## COMMENT ON RECENT DEVELOPMENTS (CONT'D)

RHEUMATIC FEVER:

Morbidity from rheumatic fever remained at .7 per thousand, which is about the same as in October 1943 although almost 70 percent under the peak rate reported from March to May 1944. The Seventh Service Command with a rate about four times as high as that for the remainder of the country continued to report the highest morbidity from this cause.

TUBERCULOSIS:

Morbidity from tuberculosis was at about the same level during October as for the year to date, namely, .9 per year per thousand strength. As of 27 October 1944 there were 1512 cases of tuberculosis remaining under treatment; these represented .90 percent of all patients in hospital. Of the 1512 cases remaining, 651 were at Fitzsimons G.H., and 512 at Bruns G.H.; the patients at these two hospitals represented 77 percent of the 1512 cases.

MALARIA:

Morbidity from malaria acquired in the United States remained at .2 per thousand for the fourth consecutive month. The current experience is about the same as that during the corresponding period of 1943.

The number of cases of malaria presumably acquired overseas which were admitted or readmitted for treatment in this country averaged about 890 per week or about 5 percent above the weekly average for September and decidedly the highest figure so far recorded.

As of 27 October 1944 there were 2224 cases of malaria remaining under treatment, representing 1.3 percent of the total patients remaining in hospital. Only 16 of these 2224 cases of malaria were those where the disease was acquired in the United States.

NEUROPSYCHIATRIC DISORDERS:

The annual rate of admission for neuropsychiatric disorders increased by about 5 percent in October over the relatively high rate experienced in September. The rate of 48.0 per thousand in October is the highest recorded in the United States during this war. In part this increase reflects the effects of WD Cir. 370, 12 September 1944 which provided that enlisted men not meeting the minimum standards for induction for whom no suitable assignments were available could be discharged.

Significant increases in morbidity from neuropsychiatric disorders in October as contrasted with September occurred in the First, Second, Third, Fifth, Sixth, and Ninth Service Commands and the Military District of Washington, while only in the Fourth Service Command was any decrease registered.

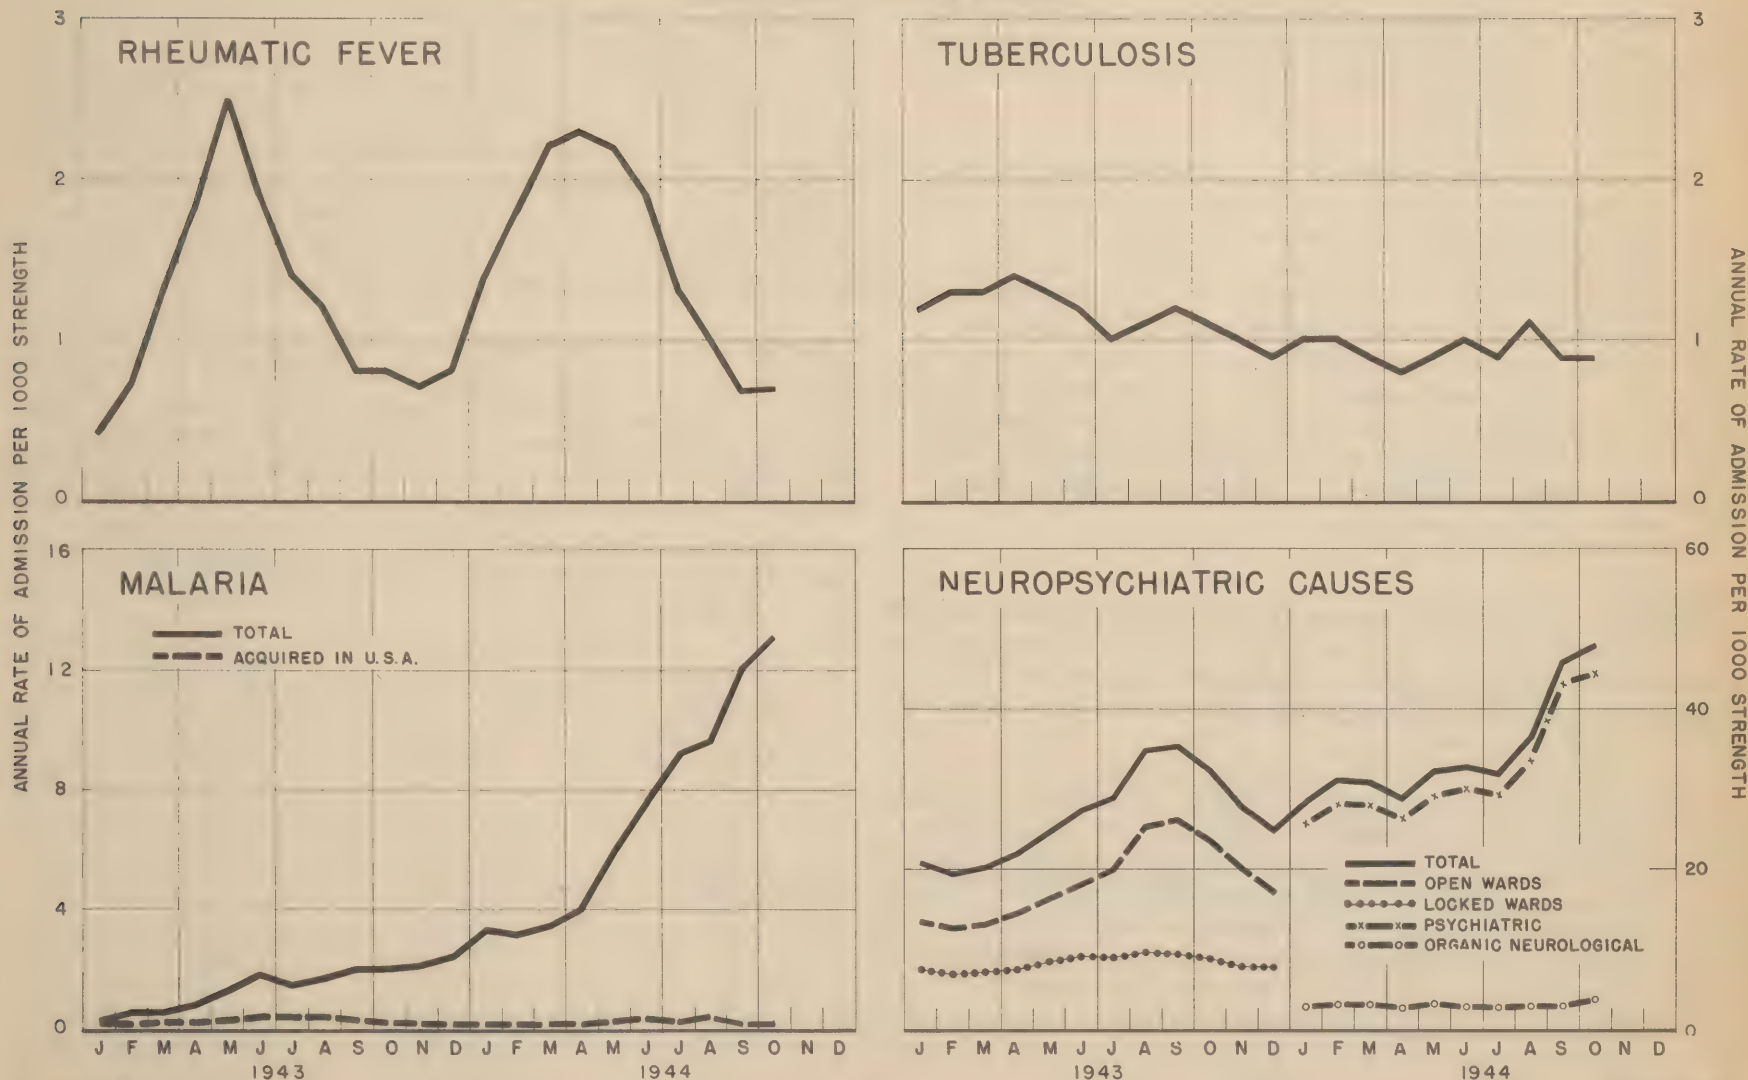

The Second Service Command reported by far the highest morbidity from neuropsychiatric disorders (69 per thousand) in large part because of relatively high admissions at Atlantic City, AAF Redistribution Station and at General Hospitals. The lowest rates was reported in the Sixth Service Command (23 per thousand).

During October there was an average of 1840 CDD's per week given to enlisted men who were classified as neuropsychiatric cases as contrasted with 1660 per week as in September. The CDD's given during October for neuropsychiatric disorders represented 36 percent of all CDD's or considerably lower than the proportion during the previous five months (about 42 percent).

In October there was a relatively sharp increase in admissions for organic neurological cases which, however, account for less than 10 percent of the total neuropsychiatric admissions. The October rate for

# MORBIDITY FROM — RHEUMATIC FEVER — TUBERCULOSIS MALARIA — NEUROPSYCHIATRIC CAUSES

CONTINENTAL UNITED STATES

## COMMENT ON RECENT DEVELOPMENTS (CONT'D)

organic neurological cases was about 25 percent above the level of about 2.8 per thousand which prevailed during most of the previous months. Psychiatric cases accounted for 92 percent of the total neuropsychiatric admissions; only in the Fifth Service Command and the Military District of Washington was this proportion less than 85 percent.

The number of neuropsychiatric cases remaining under treatment as of 27 October 1944 was 19,924 or about 600 more than at the end of September. The number of cases remaining at the end of October was at the highest level reported so far during this war. In October both open and locked ward cases increased; the number of open ward cases was the highest ever recorded, but the number of locked ward cases was not quite as high as at the end of June 1944. Neuropsychiatric cases remaining represented 11.9 percent of all patients in hospital; open ward cases accounted for 8.8 percent and locked ward cases for 3.1 percent.

MORTALITY:

Mortality from all causes during October was reported at 2.57 per year per thousand, or about the same as the rate for the year to date. The mortality rate from disease at .56 per thousand was also about the same as for the year to date.

It should be noted that reporting of deaths on Forms 86ab is known to be incomplete, especially for deaths from injury for which the understatement may have been as great as 15 percent. The mortality rate from injury when adjusted to allow for under-reporting would be about 2.3 per thousand, resulting in an estimated total death rate from all causes of 2.9 per thousand.

NON-EFFECTIVE RATE:

The non-effective rate for October was reported at 47.6 per thousand strength or 15 percent higher than in September; most of this increase arose because of an increase in hospital population at General Hospitals. Despite lower admission rates, the non-effective rate for October 1944 was 23 percent higher than for October 1943; this increase is more apparent than real since it is the result of the inclusion of days lost in General Hospitals by evacuees from overseas, who account for over 25 percent of the non-effective rate. The non-effective rate from injury in October was 8.9 per thousand, which is somewhat higher than in previous months.

Variations in the non-effective rate by Service Command do not reflect so much the variations in morbidity between Service Commands as the varying number of General Hospitals in each Service Command. When comparisons are made between the non-effective rates excluding General Hospitals, the variations in the non-effective rate by Service Command are seen to be very much smaller than when the days lost in General Hospitals are included, as evidenced in the table below:

<u>Service Command</u>	<u>Including Gen. Hosp.</u>	<u>Excluding Gen. Hosp.</u>
TOTAL U.S.	47.6	26.9
I	62.1	17.6
II	57.8	20.9
